

ACTIVE DIRECTORY USER ON-BOARDING

IT Service Request Report

Project	Enterprise Active Directory Lab
Ticket ID	AD-ONB-001 (Ticket-001-New-Employee-Setup)
Employee	Sarah Johnson
Date	11-13-2026
Environment	allsafe.local — isolated Virtual Box lab
Prepared by	te7mina1

SIMULATED LAB TICKET — NO PRODUCTION DATA

1. Ticket Information

Field	Value
Ticket ID	`AS-ONB-001`
Requester	-
Employee	Sarah Johnson
Department	Finance
Priority	Normal
Status	Implementation completed
Category	Service Request — Active Directory User Provisioning

2. Incident/Request Description

A new employee, Sarah Johnson, requires an account in the allsafe.local Active Directory domain. The account must be created in the Finance-Department organizational unit and added to the Finance-Security security group so that the account has the group membership specified by the onboarding request.

3. Objective

I aimed to provision Sarah Johnson's domain account in the correct OU, assign the requested security-group membership, and verify that the account could authenticate from the Windows 11 domain client.

4. Environment

Field	Value
Domain	allsafe.local
Domain controller	AllSafeCS-DC01
Domain controller IP	192.168.56.10
Client	Windows 11 VM — Domain-Client11
Virtualization	Oracle VirtualBox
Tools	Active Directory Users and Computers (ADUC), Active Directory PowerShell module, Command Prompt
Target OU	OU=Finance-Department,OU=USA,DC=allsafe,DC=local

5. Investigation

I reviewed the requested employee identity, target department OU, and required group membership before making the directory changes. The screenshots show the Finance-Department OU, the Finance-Security global security group, and the user object created within that OU.

The supplied ticket evidence does not identify the requester or show an explicit priority. Those fields are therefore left editable rather than treated as verified facts.

6. Implementation

I performed the following actions using ADUC:

- Created the Finance-Security group as a Global Security group in the Finance-Department OU.
- Created the Sarah Johnson user object in the Finance-Department OU.
- Set the logon name to sarah.johnson and the UPN to sarah.johnson@allsafe.local.
- Added Sarah Johnson to the Finance-Security group through the group's Members tab.
- Reviewed the membership from both the group Members tab and the user's Member Of tab.

I then used PowerShell to inspect the user object and its group membership:

```
Get-ADUser sarah.johnson -Properties Department,MemberOf | Format-List
Name,SamAccountName,Enabled,Department,MemberOf
```

The captured output showed the account as enabled and listed Finance-Security in MemberOf.

7. Testing & Verification

- ADUC group Members tab displayed Sarah Johnson as a member of Finance-Security.
- Sarah Johnson's Member Of tab displayed Finance-Security.
- Get-ADUser output showed Name = Sarah Johnson, SamAccountName = sarah.johnson, Enabled = True, and the Finance-Security distinguished name under MemberOf.
- I signed in to the Windows 11 client using sarah.johnson@allsafe.local.
- The whoami command returned allsafe\sarah.johnson, confirming the logged-on domain identity.

Scope note: successful domain sign-in confirms the identity used for the session. It does not independently verify access to Finance file shares, applications, or other resources.

8. Troubleshooting

No blocking provisioning or authentication error is documented in the supplied screenshots. The account creation, group membership, and domain sign-in checks completed successfully.

The PowerShell output did reveal that the Department attribute was blank. OU placement does not automatically populate this attribute. If the ticket requires it, I should set and verify it using the commands below:

```
Set-ADUser sarah.johnson -Department "Finance"
Get-ADUser sarah.johnson -Properties Department | Select-Object Name,Department
```

9. Security Considerations

- Use an approved unique initial password and deliver it through a secure channel; do not include passwords in the report or GitHub repository.
- The creation wizard indicated that the user must change the password at next logon.
- Assign only the group memberships required by the employee's approved role.
- Confirm authorization from the requester before provisioning in a production environment.
- Avoid storing sensitive employee information in public documentation or unnecessary AD attributes.

10. Resolution

I created Sarah Johnson's account in the Finance-Department OU, added the account to Finance-Security, confirmed the account was enabled, and successfully signed in from the Windows 11 domain client. The captured verification output supports completion of the core provisioning steps.

Before final ticket closure, I should populate the Department attribute if required and perform any resource-specific access checks specified by the request. No password or other credential is included in this report.

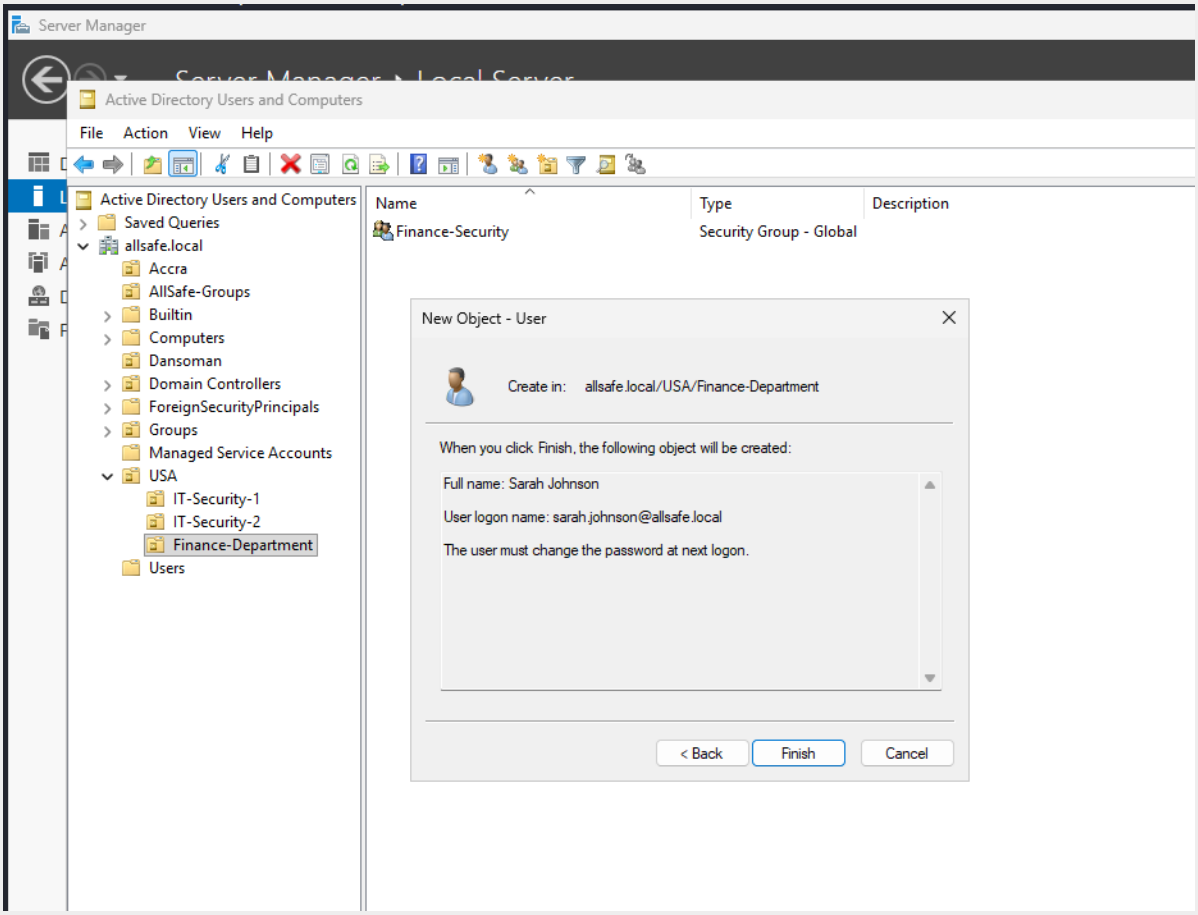

11. Lessons Learned

- An OU defines where an AD object is organized; it does not automatically set user attributes such as Department.
- Group membership should be verified from the group and user views, and can also be checked with PowerShell.
- A successful domain sign-in is useful authentication evidence, but it is not proof of authorization to every departmental resource.
- Combining ADUC with PowerShell provides both visual confirmation and repeatable administrative verification.

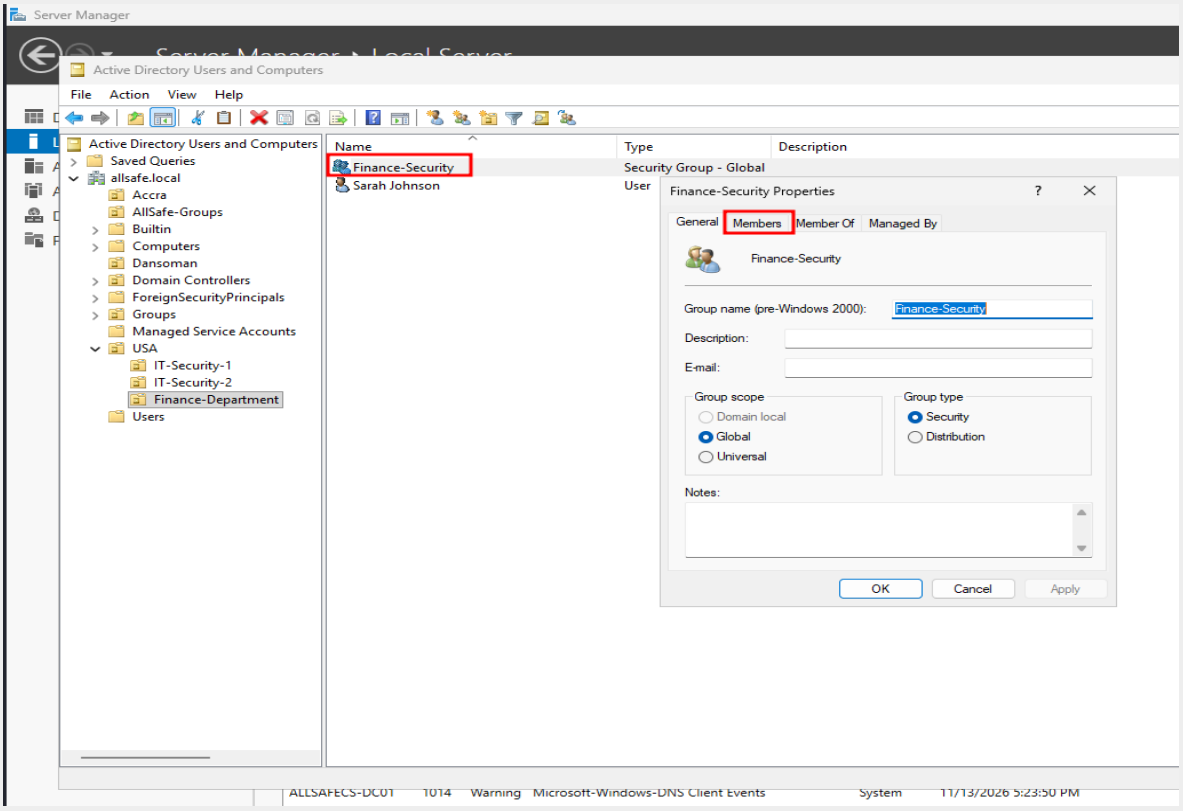

12. Evidence

The following screenshots were supplied for this report. They are inserted in upload order with captions. Review the images before publishing; redact any sensitive information that should not be public.

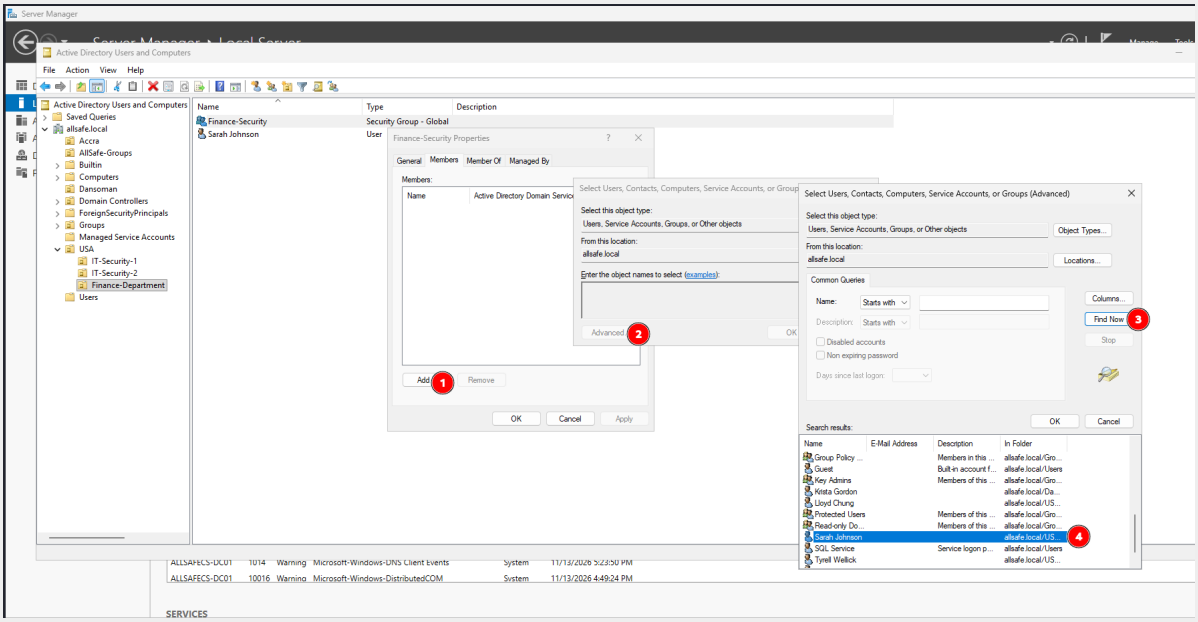

01 — New user creation confirmation for Sarah Johnson

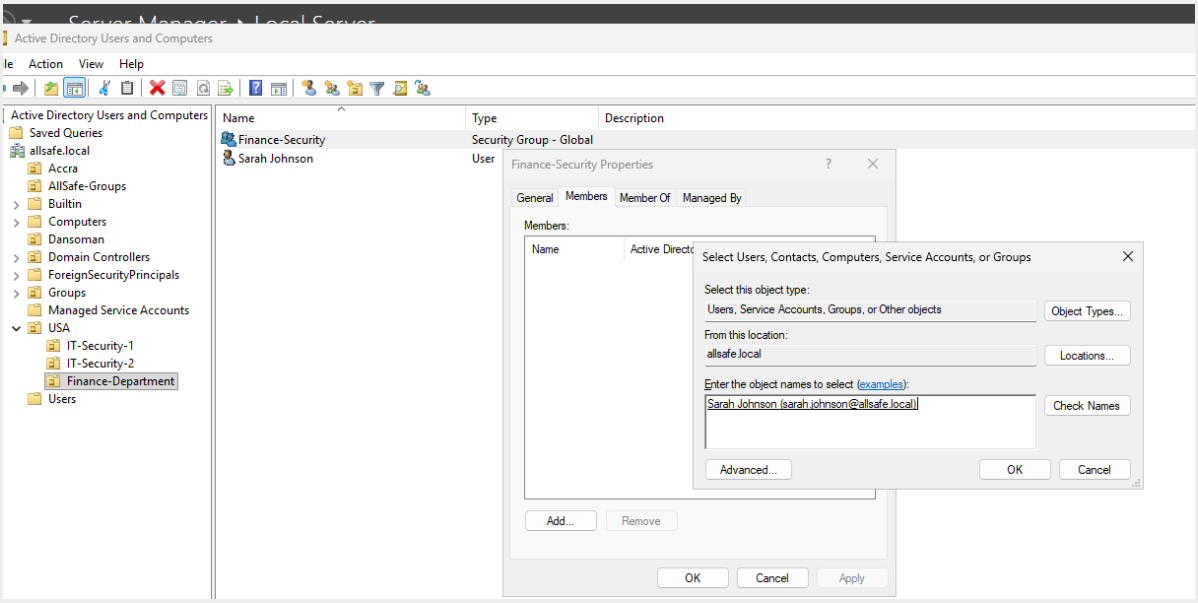

02 — Finance-Security group and its Members tab

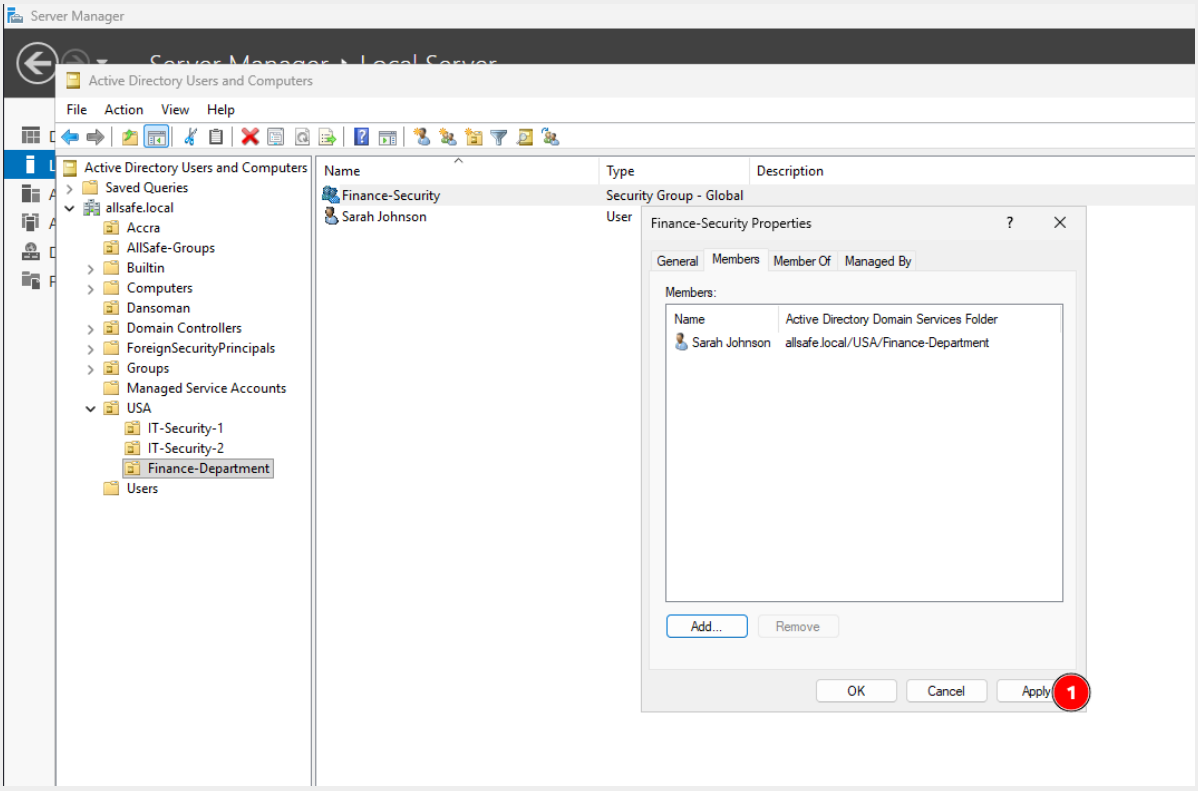

03 — Advanced object search used to locate the user account

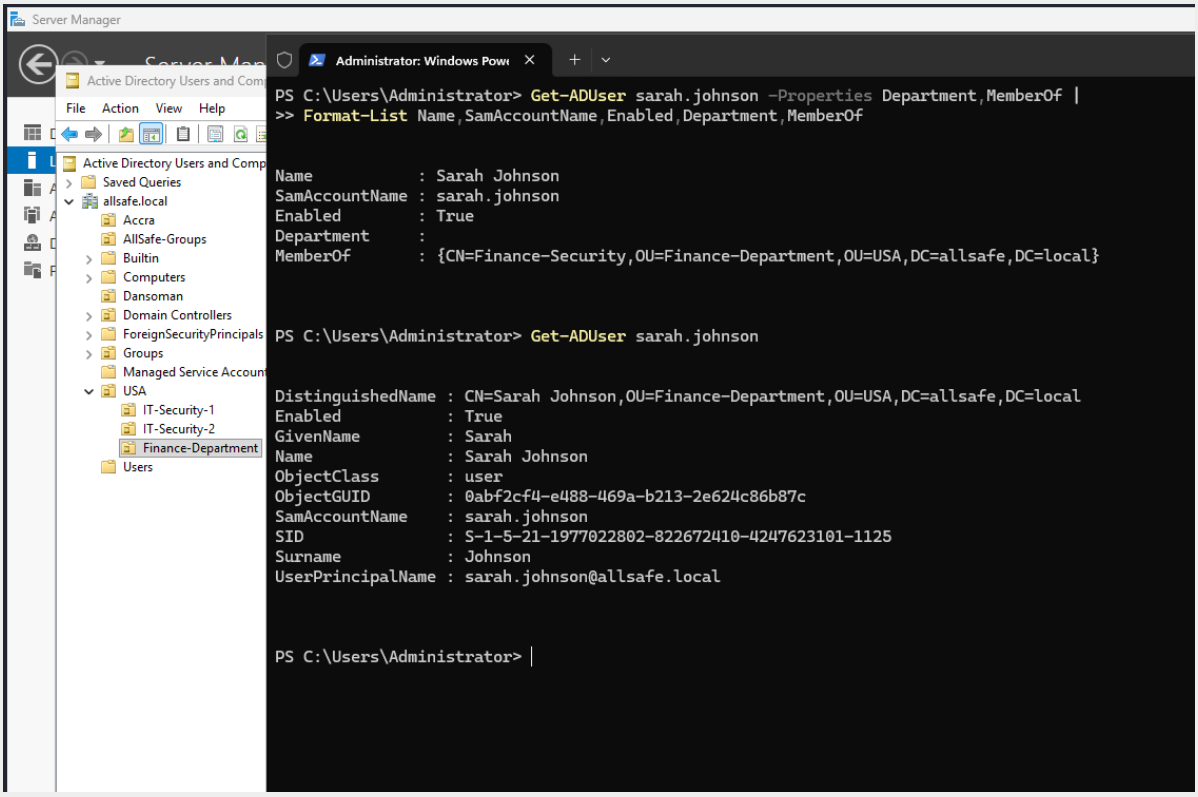

04 — Sarah Johnson selected as the group member

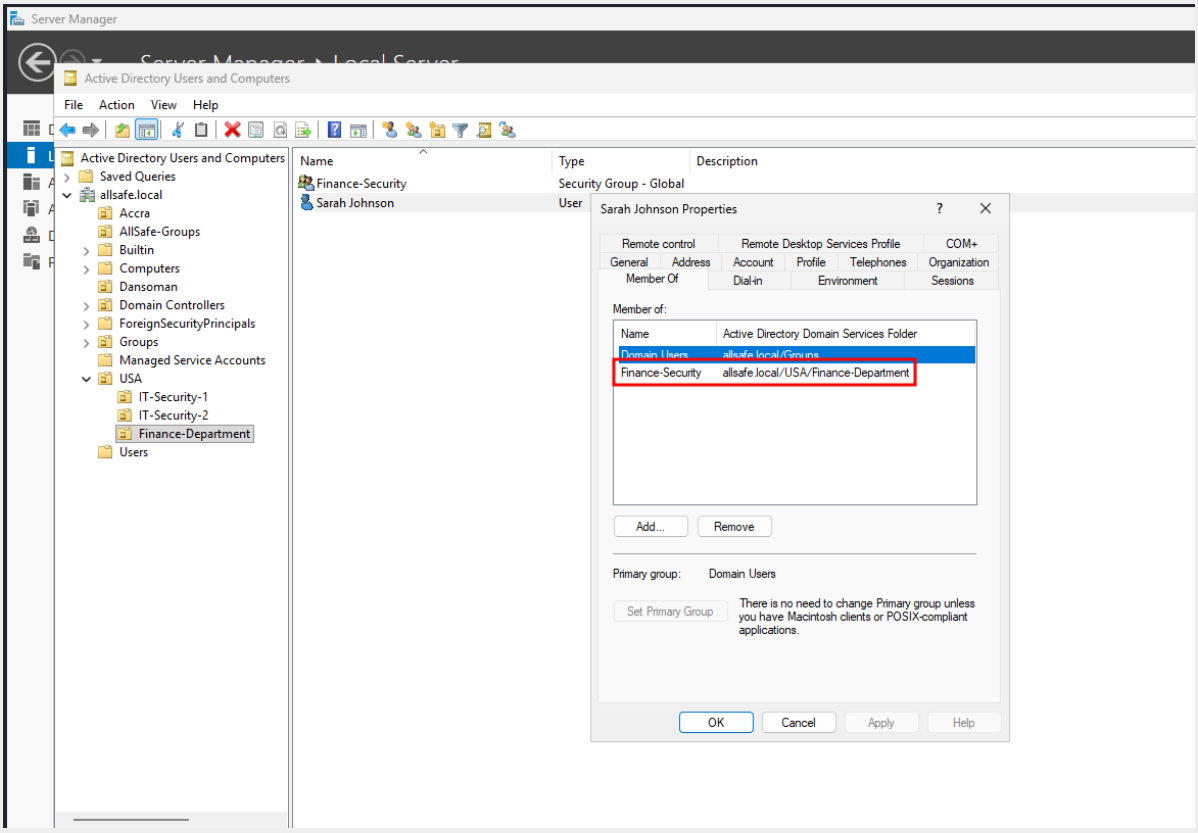

05 — Sarah Johnson listed as a member of Finance-Security

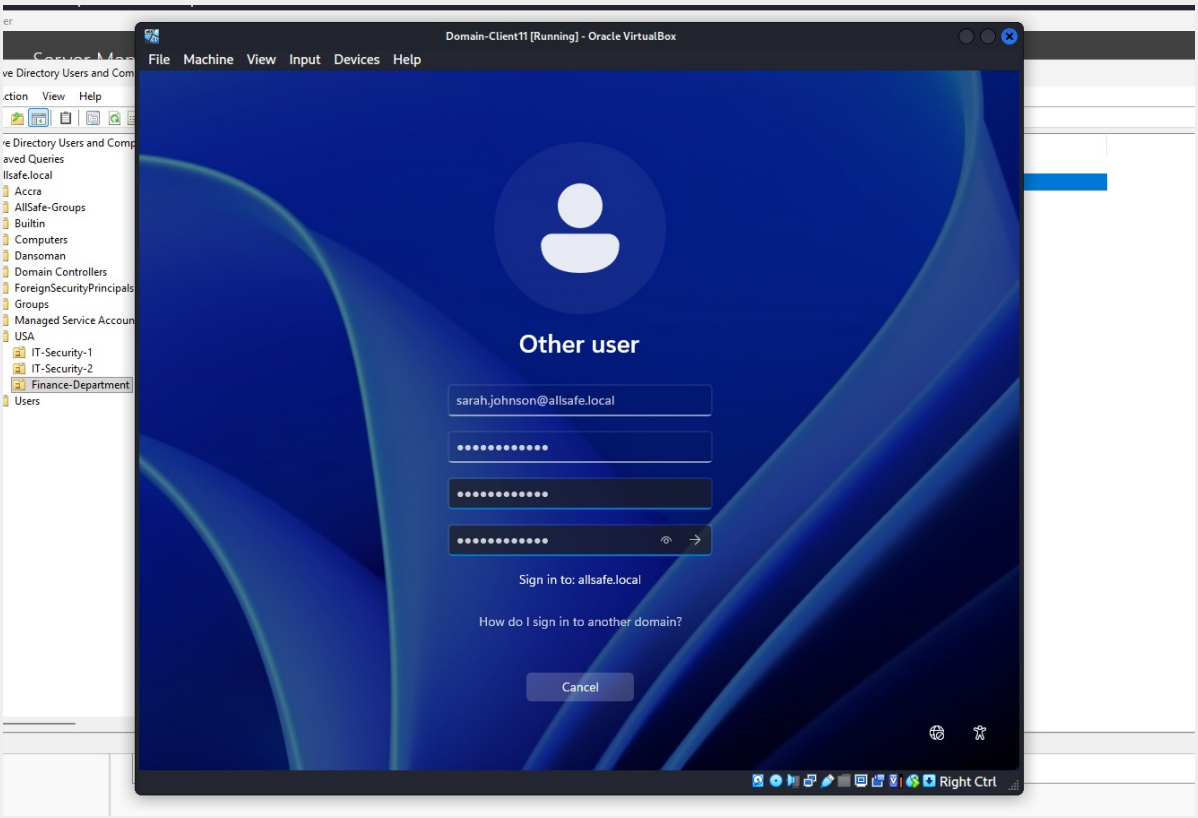

06 — PowerShell verification of the account and group membership

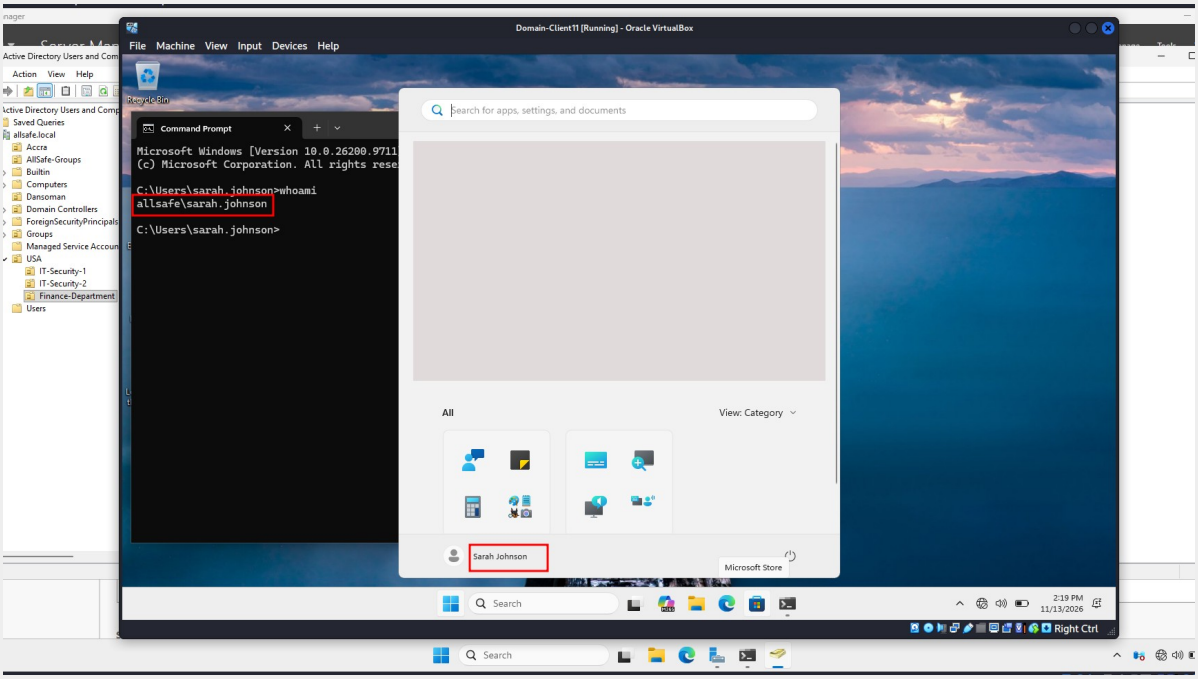

07 — User account Member Of tab showing Finance-Security

08 — Domain sign-in screen using Sarah's UPN

09 — whoami output confirming allsafe\sarah.johnson

10 — Windows account information showing Sarah Johnson and the domain identity
